托福独立写作 满分范文

托福独立写作满分范文下载

托福独立写作可谓是托福考试中的一道拦路虎，在这里为大家整理一篇托福独立写作的满分范文，供同学们参考。

Does technology make children less creative than in the past?

Are our kids becoming lazier and less creative, less imaginable than before as a consequence of highly advanced technology? My answer is no, and just the opposite, technology has apparently assisted our kids to become more creative.

First and foremost, technology has provided children with easy access to scientific and liberal art resources which is their best source of inspiration. For example, children could now easily gain access to academic databases through iPad screen, read classical works on Kindle, or watch historic documents on Internet. These great works are essentially helpful to arousing their curiosity and prepares them with key knowledge necessary for any creation. However, these wonderful equipments and facilities are never as handy in the past, when kids could only reach limited resources in public libraries or schools. In this sense, technology has provided the possibility for children to be more creative.

Second, technology has equipped children with professional apparatus which could finally realize their imagination. This takes form particularly as computer softwares and applications, such as Photoshop for creative graphic design, Overture for easily composing a piece of music, 3DMax for building up a virtual world, etc.. All the software were never as handy as they are at present, and this

would absolutely provides our children an effective tool for realizing their creativity.

Third, technology itself is a market place where creative ideas are economically encouraged. Steve Jobs earned millions of dollars a year for his unparalleled creation, and Mark Zuckerberg gained his reputation for the genius social network. Therefore, technology has provided children the internal motive to develop their creativity.

However, it is undeniable that technology might make children become lazier and be comfortable with what is already available because everything are so convenient nowadays and there seems to be no way to improve them. Children lost in pc games or blindly pursuing every single piece of tech apparatus is a relevant example. Thus, it is always necessary to keep children's mind active in the marvelous world of technology.

In a nutshell, I still regard children as becoming increasingly creative in technology development, although it might bring minor side effect. As long as we keep a balanced mood on children enjoying the fruit of technology, they are sure to contribute more to innovation than in the past.

2016 年 9 月 10 日托福独立写作范文

The question of “ what is the most important subject or skill the elementary schools should teach? ” has never failed to attract attention from educators,

school administrators and even politicians especially when it comes to subjects like technology, or music and art. Some argue that school should spend more time teaching technology than music and art. Personally, I am not in favor of this position based on the following reasons.

Admittedly, with the advent of internet and state-of-art gadgets like laptop, tablets, being able to use computers skillfully is being considered as a valuable quality. However, early exposure to computers and other kinds of technological products might bring lots of risks and problems to kids' future development. Recently research by National Society of Psychiatrists shows that exposure to computers at an early age leads to addiction to computers when they grow older and obviously spending too much time in front of the computer can pose a threat to kids' health, to be more specific, it leads to neck problems, nearsightedness, backache and even childhood obesity. Moreover, instead of getting addicted to playing on-line games and watching meaningless videos, kids should have spent more time focusing on their academic study, or even learning how to appreciate artwork or music. Indeed, spending more time learning art and music not only benefits the kids, but also it is conducive the community as whole.

First off, learning art and music at an early age helps to develop creativity and make the kids more imaginative. Actually, lots of scientific research in the psychological field shows that early exposure to art and music not only boosts academic achievement but also promotes creativity, self-confidence and school

pride; kids who spend more time in learning art and music end up having higher analytical thinking and reasoning skills than kids who don't.

Additionally, spending more time teaching kids music and art can benefit the whole community. Music and art are a very important part of people's lives. They are necessary for people to express their emotions, like happiness, sorrow, and even anger regardless of cultural background, ethnicity, age and even gender. It is very urgent to spend more time teaching kids knowledge about art and music since they bring change, facilitate innovation and help to unite the community. They are the reminder of the past and maker of tomorrow, they also help to convey ideas and different perspectives. More importantly, art and music have great cultural significance, by learning art and music kids will have a strong sense of cultural identity and sense of belonging to community, eventually the traditional values and culture can be passed down to the younger generation.

To conclude, it is more advisable to spend more time teaching kids art and music than technology since not only can art and music benefit the individual kid but also it benefits the community as a whole. (By Meng, Yan 448)(新东方 孟炎)

2016 年 10 月 29 日托福写作范文:

People tend to respond to problems differently given the fact that personalities may vary among different individuals. When it comes to the question of whether or not to solve the problem based on one's own experience and knowledge or solicit

others advice, I tend to believe that it really depends on the nature of the problem and we can not draw a definitive line here.

On the one hand, a rookie without any experience in a particular field can learn a great deal of knowledge and develop useful skills when learning from an experienced individual. For instance, when my father taught me how to ride a bike, I remember his experience and knowledge were extremely useful. My father sat me on the paddle with one feet hanging in the air, and I hold the handlebar straight and bent my arms a little bit so that I could keep balance. After my dad's instruction and guidance, eventually I learned how to ride a bike. Also, in a working environment, the knowledge and experience of senior employees can be very helpful for someone who hold junior positions in the company. The expertise of senior workers have proven from time to time that a certain strategy of business operation cannot be paralleled by any other approach. Indeed, a recent study done by the National Society of Organizational Behavior indicates that one enjoys a better chance to be successful in his professional life if he gets intensive coaching and training from senior managers during the first two years of his job. Consequently, we can conclude that on some occasions it is beneficial for someone to capitalize on others' experience and knowledge.

On the other hand, for problems, setbacks or major decisions that have a significant impact on the individual's life, it is not rational to be influenced by others' opinions and perspectives. For example, when you have big decisions like

which university to attend or whether or not taking on a new career path, it is far better for you to figure it out and sort it through by yourself other than solicit the advice from others. Above all, nobody knows you better than yourself. You are the one who needs to live with the decision and other people won't be the ones with the consequence. Frankly, it takes a lot of courage to stand up and take personal responsibility for your own decision. Any decision made out of assertiveness and confidence should be respected, however, nobody shows any respect to those who are wishy-washy and hesitate to make their own decisions.

In conclusion, we cannot readily draw a definitive line on question of is it better to use your own knowledge and experience than ask others' knowledge and experience to solve problems since it has to be examined case by case. (By Meng, Yan word 471)

2016年9月10日托福独立写作范文

With the advent of internet, people in growing numbers are getting addicted to logging onto the internet out of various purposes, which has aroused deeply social concern. Therefore, the issue of whether the bills of using the Internet should be paid by the government or the users themselves has been open to debate. In my opinion, it is more reasonable to require the individuals to cover the fee of internet usage, with the reasons as follows.

To begin with, the users of the internet are supposed to pay the bills in order to relieve the financial burden of government. With the popularization of the internet, the number of people going online every day has increased to a lot, which means that the money spent on the internet is tremendous. Such a large sum of money can do nothing but occupy a great proportion of the governmental expenditure, thus cutting down on the investment of government on other more pressing fields like improving the public transportation and eradicating the poverty. By contrast, if the fee of internet usage comes from the wallet of the individual, the situation will become totally different. To illustrate, the abundant financial resources of government saved by this practice can better facilitate the economic development and render the life of the mass more convenient and comfortable.

In addition, requiring the individuals to pay for the bill of internet access will help to establish better social relationship between people. As is common sense, with the wide application of electronic devices boosted by easy access to the internet, people especially youngsters are indulged in the cyber or virtual world created by the social network and various Apps on the cell phone. Consequently, it is not uncommon to observe that when a group of white collars sit at a table in a restaurant waiting for their meals, they watch the screen of their smart phones instead of interacting with the guys near them, which greatly alienates the bond between them. In this case, the free use of internet will aggravate this situation to

a large extent. However, if the fee of the internet usage is covered by the individuals instead of the government, many people will be reduce their time spent in surfing the internet in order to save money. As a result, the face-to-face communication will become more frequent and thus the closer and more intimate relationship between people will be set up.

Factoring the above listed reasons, it is safe to conclude that the government should not offer internet access to all of citizens at no cost, in order to relieve financial burden of the government and to build a better rapport between people.(新东方 赵波)

2016 年 10 月 15 日托福独立写作参考范文:

Currently, with the competition in the job market becoming increasingly fierce, the job-hunting has been brought under the spotlight of the mass media. The senior and experts strongly proposed that young people should try different jobs before taking a lifelong career, while the youngsters may hold the opposite viewpoint. As far as I am concerned, the former view is more reasonable, with the reasons listed below.

In the first place, different jobs will equip the young with multiple skills and professional knowledge in various fields. As we know, the completion of every job, simple or complex, requires differing abilities and expertise in certain area. As a result, young adults who take different jobs will grasp the knowledge in a new area

and increase their potential capability to a large extent, thus having the well-rounded development. To be specific, to be a waiter or waitress in a restaurant enables us to cultivate interpersonal skills since we may encounter tons of people from all walks of life. Being a manager will help to improve the organizational skills and leadership, because the successful running of a department depends on the ability of leaders. Undoubtedly, those people with more than one skills will have an edge over other competitors in the future job market.

In addition, another conspicuous benefit of taking different jobs before you settle on the lifelong career is that the young have the chances to find the most suitable position. It is never uncommon to hear that many employees who have worked for three or more years complain that the work they take is not what they are good at or what they like. Consequently, their enthusiasm or passion for their jobs is relatively in a low level, which has negative influence on the development of themselves and their company. The best way to deal with the above problem is to allow youngsters to try different types of work at first and take the one which suits them most. The experience of my friend, Kozer, is a good case in point. After graduating from the department of foreign languages in Beijing University, Kozer was recruited by a Foreign Trade Corporation due to his excellent English. Unfortunately, he was too introverted to communicate well with strangers, especially with foreigners. Then he resigned from the position and became a teacher in a high school. The same problem occurred again. Finally, realizing his

own strengths and weaknesses from the above failures, he found that the most suitable position for himself was to be an editor for China Daily, the most famous English newspaper, because there was no need to talk with many people in this job.

Admittedly, some opponents may assert that it is not necessary for young adults to try different jobs, because it will waste lots of time and even make them miss out some opportunities. However, the above reasoning is far from the truth. To illustrate, only when we have experienced several different kinds of work can we find the one which most fits for us. So the time spent on every try is worthwhile.

In a nutshell, it is safe to conclude that young people should try different jobs before they take a long-term career, in order to gain more skills and find the most suitable position. (By Zhaobo, 548words)(新东方 赵波)

2016 年 10 月 22 日托福独立写作范文

Under the current educational system, the extracurricular activities designed for students are playing an increasingly important role. Therefore, among parents and teachers, there arises a controversy pertaining whether teenage students should participate in various activities or focus on one activity. Towards such a long-running tug-of-war, I strongly recommend teenagers to engage in more kinds of activities, for the following reasons.

Initially, getting involved in more activities can be conducive to the well-rounded development of students. It is self-evident that different activities can equip participants with various skills and abilities. To illustrate, students attending musical classes can learn how to appreciate the classical works of famous musicians and thus improve their aesthetic capability. Similarly, participating in team sports will help students cultivate a sense of cooperation as well as enhance their leadership. After having obtained the above skills, students definitely can develop in an all-round way, with the result of becoming more competitive than others. In contrast, specializing in only one kind of activity is a totally different picture. In other words, students just foster one particular skill, which is a potential obstacle to their future development. The underlying reason is that the more and more complicated modern life necessitates the acquisition of multiple skills.

Furthermore, taking part in many after-class activities can do a better job in helping students find what they are interested in. Just as a saying goes, interest is the best teacher, which clearly indicates the great role played by interest in all levels of education. The above claim is especially true of teens education, because they are in the puberty, the most rebellious period. Put it in another way, without the drive of their own interest, they are less likely to perform well in any activities required by their teachers. In this case, offering various activities to adolescents undoubtedly can more effectively stimulate their interest and passion. Once they

find what they like, they will automatically put more efforts and time in it.

However, requiring all teenagers to solely engage in one activities may fail to cater to the interest of the majorities of them.

All in all, we can draw the conclusion that it is a wiser move for students to attend multiple activities, in order to obtain a holistic development and find what they are passionate for. (新东方 赵波)

2016年9月24日托福写作 范文

There is no denying that happiness originates in the acts of meeting people's various needs. Nowadays some people claim that happiness is more affected by the job they owned than their social life. This is a popular misunderstanding. As far as I am concerned, social life and jobs have the equal role in making people feel happy, because they can respectively satisfy people's different needs.

On the one hand, a decent and well-paid job can provide us with a large amount of money, which could fulfill our material needs and improve our living standards. For example, with adequate financial resources we can live in a spacious and well-decorated house with six bedrooms and eight restrooms. We can travel around the world and visit the Forbidden City in China, the Liberty Statue in America and the Big Ben in Britain. In addition, such a good deal of money enables us to keep fit by having nutritious diet and mineral water

transferred from the water source. Meanwhile, we can hire a personal doctor around the clock in case of any emergence of disease. We do not have to wait for a long time by standing in the long and crowded lines of patients in hospitals. All these things will definitely make us feel happy.

On the other hand, the important role of social life in helping us attain happiness can not be ignored. Confucius, one of the greatest philosophers and educators in China, once remarked that it is a pleasant thing to meet with a friend from afar, which indicates that friendship is another source of happiness.

Participation in social activities will enlarge our social circle and make us make acquaintance with more people. For example, if you are a bookworm, you can take part in readers' association where you will encounter a lot of people who share a common interest. Chatting and talking with them will help form a deep friendship and make you have a better mood. The reason underlying the above example is that your need of communicating with others is met by participating in social life.

In conclusion, since happiness depends on the fulfillment of one's need, social life and jobs combine together to make us happy. It is an exaggeration to say that your job has more effects on happiness than your social life. (新东方 赵波)

2016 年 11 月 5 日托福独立写作范文

The question of “ what is the most important subject or skill the schools should teach? ” has never failed to attract attention from educators, school

administrators and even politicians especially when it comes to subjects like technology, engineering and math. Some argue that students should be encouraged to take such classes rather than the ones they are interested in since they give them a better shot to find jobs. However, personally, I am not in favor of this position based on the following reasons.

Admittedly, it is true that courses like technology, engineering and math are very

technical, most of which can be applied in solving real world issues. However, the exposure that students have to apply these theories are very limited in class. Taking technical oriented classes will not give students a competitive edge to ensure future jobs opportunities, on the other hand, there are enormous benefits for students to take courses that they are interested in.

First off, taking courses that students are interested in can be a great motivation for them to achieve higher goals. Old saying “interest is the best teacher” remains relevant as it did a century ago. Interest serves as the internal motivation for students to explore in the area that they are interested, on the contrary, if they are forced to take courses for a utilitarian purpose, they might not keep their interest for a long time thus have a lower learning efficiency. Recent study conducted by the Society of Developmental Psychology shows that students will be more enthusiastic and passionate about learning when given the freedom to make their own choices to take classes. Also, giving students the opportunity to

choose the classes they are interested in can help them to explore their real interest, thus their potential can be fully tapped before heading off for career options.

Additionally, taking courses students are interested in have enormous practical purposes and they can be a great source of leisure and relaxation. For instance, lots of students like art and music but seldom do they have a chance to learn. Actually, taking art and music classes help to develop creativity and make the students more imaginative. Actually, lots of scientific research in the psychological field shows that early exposure to art and music not only boosts academic achievement but also promotes creativity, self-confidence and school pride. Students who spend more time in learning art and music end up having higher analytical thinking and reasoning skills than those who don't.

In conclusion, taking courses that students are interested in can be a great motivation for them to achieve higher goals and it can also be a great source of leisure and relaxation. (新东方 孟炎)

2016 年 11 月 12 日托福独立写作范文:

Educators and researchers have never stopped the examination of the importance and relevance of collaborative and interactive learning that are encouraged by middle schools. When compared with boring lecturing, I,

personally, believe that it is far more beneficial to students when they share their ideas and exchange opinions with each other for the following reasons.

First off, exchanging ideas with fellow classmates help students develop critical thinking, presentation skills and other kinds of soft skillsets. When discussing issues with peers, students tend to take a position on a certain issue. In this learning process, students will collect their thoughts and synthesize the concepts learned in textbook or in the lecture to support his or her points. Also, to respond to others' comments, students have to reflect on the rationale of their own arguments and come up with persuasive reasoning. It is obvious that such activities helps students to learning more meaningfully and extensively. Furthermore, students unconsciously learn how to express themselves affirmatively and make their points clear in front of a large audience. It takes right amount of eye contacts, body language and facial expression to convey one's idea in a convincing way and such presentation skills can be valuable asset for one's future career.

Additionally, actively discussing issues with peers can help students to cope with different opinions. When discussing issues with peers, not only do student contribute to the class, but also they get a chance to be exposed to different ideas and perspectives. This is a very conducive experience since we are not living in a vacuum and learning how to appreciate, value and even embrace opinions that are unfamiliar to us can be very important. Furthermore, such experience can be

useful in one's future career when one also has to confront with different business solutions provided by their coworkers. A recent study conducted by Harvard Business Review shows that the one who experienced group discussions and exchanging of views in school demonstrates a higher potential to resolve possible conflicts with future coworkers and enjoys far more promising future.

In conclusion, discussion and idea exchanges should be encouraged since such activities can help students to develop critical thinking, presentation skills and other kinds of soft skillsets, also they will get students prepared on how deal with different opinions now and in future career. (386 words, By Meng, Yan)(新东方孟炎)

6月18日托福独立写作范文如下：

Under the current society full of intense competitions, how to achieve success has never failed to arouse deep concern and interest among the general public. Thereof, a good deal of accomplished businessmen and elites are strong believers of the claim that to be a successful person, one must be open to new ideas and willing to change his or her mind. Towards such a complicated issue, I am in favor of the above claim for the following reasons.

In the first place, being receptive to new ideas can help people to better adapt to the constantly changing environment and thus become successful. As is common sense, no matter what fields or areas you are engaged in, change has

become the perpetual topic, which means that what you held firmly onto before may become outdated and even misleading overnight. In other words, only those people with open mind towards new things can keep pace with the changes of time and are more likely to achieve success. By contrast, rejecting any new ideas and never changing one's mind, people will be gradually surpassed or even replaced by other competitors. A good case in point is the collapse of Nokia Company, the once most famous cell phone brand. On account of showing no acceptance to the new operating system Android, the Nokia has announced bankruptcy and has been acquired by Microsoft Company. The same logic can apply to any individuals who are stubborn.

Besides that, embracing new ideas can help people to build harmonious rapport with more people, leading to the higher likelihood of becoming successful. More scrutiny has made it conspicuous that an attitude of open-mindedness is strongly correlated to one's popularity among others, especially in a work team. The underlying reason is that anyone who has a willingness to listen to new thoughts tends to leave a good impression and thereof gains help or assistance from others when faced with troubles in the path to success. Also, being open-minded helps you work through interpersonal or intra-team conflicts that arise when people work in close quarters. By contrast, insisting on one's own view stubbornly usually not only build a barrier for establishing the friendship but also serves as the origin of quarrel or conflicts with other people. Put it another way,

people without a spirit of listening and cooperation have difficulty in completing any projects, let alone, become successful.

Indeed, accepting new ideas may make people feel uncomfortable, because they are forced to get out their comfort zone. However, the above reasoning does not bear deep analysis. To illustrate, it is an indisputable fact that success relies on nothing but innovation driven by constantly taking in original and creative ideas and thoughts. Consequently, factoring what has been mentioned above, we can conclude that showing acceptance to new ideas and changing one's mind accordingly are of great necessity for the sake of achieving success.(新东方 赵波)
